

ACT TEST **AUDIOSTAR PRO**

The Audible Contrast Threshold test, or ACT™, is a new test available on the GSI AudioStar Pro™. The ACT offers a quick 2 minute test to accurately estimate a person's real-world ability to understand speech in noisy environments. The ACT results provide a reliable correlation with aided speech-in-noise performance and is language independent. This means the ACT test can be performed on any patient regardless of their native language. The test utilizes the patient's audiometric test results to ensure the ACT stimulus is audible.

KEY FEATURES
